Monitoring Health Inequalities by SES: Lessons from Scotland

March, 2013

John Frank, Director; Scottish Collaboration for Public Health Research & Policy, Edinburgh (www.scphrp.ac.uk) Chair, Public Health Research and Policy, University of Edinburgh; Professor Emeritus, University of Toronto.
Key Questions for the Scottish Collaboration for Public Health Research and Policy (2008-):

- What are the key public health and primary care interventions that can efficiently improve population health status in a setting like Scotland?

- How capable are these interventions of also reducing socio-economic disparities in various health outcomes, and over what time-frame?
Life expectancy trends

Obesity in OECD Countries: % Adult Population (≥15 years) with a BMI ≥ 30kg/m² (Source OECD Health data 2006)
COMMONLY USED “SUMMARY INDICES” OF HEALTH INEQUALITY BY SOCIAL CLASS

Relative Index of Inequality = Slope Index / Overall Population Level of Same Outcome in Same Period --- Unitless, so can use to compare inequality over diverse health outcomes.

*Figure 1: Disease rate - Slope Index of Inequality*

A horizontal line would indicate equality across the deprivation groups.

The slope of the best fit line indicates the degree of inequality.

Weighted Linear Regression
Age specific contribution to inequalities in specific causes of death, across SIMD quintiles (Scots men 2000-02): “Two Paupers’ Graveywards”

One, growing, for the younger poor, dying of "external causes"

The other, stable in size, for the older poor, dying of excess chronic disease

Scots’ outlier status: the “glass ceiling” of no qualifications?

SCOTLAND = 2.25
Time-Trends in Health Inequalities: The Example of Modern Scotland

• Some important inequalities are stubbornly resistant to policy/program and practice efforts to reduce them – it is as if lower socioeconomic status confers the same sort of health risks across different eras, even when the specific causes of illness and death change.

• How are Scottish health inequalities doing recently, given that many policies have been aimed at reducing them in the last decade?
Scottish HI Indicators in Current Use

- Recent Scottish analyses of health inequalities’ time-trends and patterns, by SES, over the last decade or more, are among the most statistically sophisticated in the world – BUT...

- The rich-poor gaps in about a dozen key Scottish health outcomes appear, over the last dozen years, to be frozen in time (virtually static)...

- While one might conclude – and there is some truth in this – that insufficient policy and program effort has gone into actually reducing the “rich-poor” and “educated-uneducated” gaps in Scottish society, there are compelling reasons to believe that the population health indicators currently in use in Scotland aren’t very responsive to any feasible PH interventions likely to be actually carried out.

Absolute Range: Healthy Life Expectancy (Males)

Absolute Range: Healthy Life Expectancy (Females)

Why are major causes of mortality – and many other routinely collected health outcomes -- are no longer very sensitive to societal changes, in the short run?

- Many epidemiologists now believe: “Improved medical care – and indeed most deliberate health policies and programs – at least in developed countries, now only reduce broad categories of mortality rather slowly, and all-cause mortality very slowly,” because:

  - Life expectancy, and even all-cause mortality rates, appear to be subject to “epidemiological momentum / inertia:” they are hard to shift quickly, largely because deaths occur mostly among the elderly, where chronic disease with lifelong roots, and competing risks, matter!

- Some other routinely collected outcomes, such as low birth-weight rates and hospitalization rates, suffer from other serious flaws.
What about early-life disparities? – the curious case of LBW (=prevalence at birth:<2500 g.)

Q: How to explain the complete plateau-ing of high-SES LBW rates?  
A: LBW= (SGA +true Pre-Term) Births, and these are moving in opposite directions int’ly, so LBW now very stable.

Rates of small-for-gestational-age (SGA) live birth, preterm birth and low birth weight*
Canada (excluding Ontario), ** 1995-2004

*Live births with unknown gestational age or birth weight, gestational age <22 weeks or >43 weeks, and multiple births were excluded for SGA rate calculations.

** Data for Ontario were excluded because of data quality concerns.

Weakness of LBW as a Perinatal Health Indicator

There are two opposing secular trends in birth-weight in developed countries, at differing BW ranges, for differing reasons, LEADING TO VERY STABLE LBW RATES OVERALL:

a) increased LBW induction/caesareans, resulting from modern OB management of foetal risk, in ever-older mothers (at higher SES levels) or continuing patterns of high-risk, such as low age and smoking (in lower SES mothers) leading to higher LBW rates, at 32-34 weeks;

All these phenomena vary by SES -- so “crude” LBW rates/trends by SES are almost un-interpretable
BUT, IN 2006 IN SCOTLAND, “SMOKEFREE” LEGISLATION UNEXPECTEDLY HAD A BIG IMPACT ON BOTH CAUSES OF LBW!

11% DECLINE IN PTBs, ALMOST OVERNIGHT! (& SGA BIRTHS DROPPED 5%)

Absolute Range: Alcohol-Related Mortality
45-74y – Scotland 1998-2008
(European Age-Standardised Rates per 100,000)

Figure 11: Absolute range: Alcohol related mortality 45-74y, Scotland 1998-2009
(European age-standardised rates per 100,000)

Question: Are the poorest drinkers dying more often, or are more heavy drinkers just dying in the poorest places (after losing house and job)??

Alcohol-related mortality amongst those aged 45-74y by Income-Employment Index: Scotland 2006
(European Age-Standardised Rates per 100,000)

Unlike most Scottish inequalities, the SES gradient is non-linear: the burden is concentrated among the very poor, suggestive of “reverse causation” – i.e. chronicity of alcoholic illness in this age-group low SES: downward social mobility

The cup is half-full: all SES group’s rates have come down, equally. But the trend in the Relative Index of Inequality doesn’t show that..

The RII has steadily increased over time – illustrating a disadvantage of the RII (when adverse outcomes are improving)

![Relative Index of Inequality (RII): CHD mortality 45-74y - Scotland 1997-2001](chart)

(RII = SII divided by population mean rate)

SES gap not decreasing *proportionately* faster than overall rate: RII goes up over time – and the Minister is unhappy (“Why should our record look bad if things are improving?”)
Absolute range: First-ever hospital admissions for heart attack <75y – Scotland 1997-2008 – i.e. those “arriving alive”

Something odd is happening here – why is the ratio of poorest- to richest-decile admitted-alive cases only about 2 or 3 to 1, when for deaths it is closer to 3.5 to 1? Which SES-group’s deaths are occurring before admission more often?

I.E. Why Might “AMI Arrived-Alive” Studies Show Artifactualy Small SES Gradients for CHD Hospital Admissions?

- All hospital-based studies omit a substantial fraction of “sudden deaths” dying before admission.
- In Scotland, the MONICA Glasgow Study, with a population-based registry that included all CHD deaths (including sudden and untreated) also showed:
  » Only 66% of “coronary death cases” aged 25-64 reached hospital and 2/3 of all deaths were out of hospital, with clear SES gradients in total and out-of-hospital mortality, but none in the subset who reached hospital (Morrison et al BMJ 1997;314:541)
  » 1) Is this an important problem?
  » 2) Why might poor Scots with AMI die so quickly?
Of 93,701 incident AMI events, 50,075 (53%) resulted in death, of which **42,189 (84%) died within the first day** – ergo, surely prevention is at least as important as care?

Should there be a focused research program on sudden death here? One place to start would be....
 Local Scottish data now show 5-fold+ gaps across SES extremes

Source: Wald and Nicolaides – Bouman, 1993; Bridgewood et al, 2000

Smoking among the proportion of women who smoke has declined sharply but the gap in prevalence between poorer and better off groups is widening

New SLS (2003) Smoking/Obesity Results from Popham & Boyle (2010 -- commissioned by SCPHRP) : Relative Index of Inequality Across EU

Figure 9 The Scottish education relative index of inequality (red line) for current smoking and obesity plotted against results for Europe from Mackenbach et al. 2008
Absolute Range: Cancer Incidence (all sites) <75y – Scotland 1996-2007

Figure 9: Absolute range: Cancer incidence <75y, Scotland 1996-2009
(European age-standardised rates per 100,000)

[NO PROGRESS OVERALL -- BUT DOES IT MAKE SENSE TO COMBINE ALL CANCERS IN ONE STATISTIC, WHEN THEY DIFFER SO WIDELY IN THEIR SES GRADIENTS’ DIRECTION AND SHAPE?]

Pattern A: “flat” (but *unexpectedly so for breast cancer! -- SES reverse gradient is now 1.3-fold in England: Why is low-SES risk NOT less in Scotland?)
Environmental Tobacco Smoke and Breast Cancer

- Meta-analysis of ETS exposure effect on pre-menopausal breast cancer:
  - OR 1.68 (95% CI 1.31-2.15) for all studies, but
  - OR 2.20 (95% CI 1.69-2.87) for studies with high-quality exposure measures
  - Miller MD et al. Preventive Medicine 2007; 44:93-106

Could Scottish women at lower SES levels have been exposed to so much tobacco smoke, even as non-smokers, that their breast cancer incidence rates show an unexpected elevation, flattening the usual "reverse SES gradient"?
Cancer of the trachea, bronchus and lung (ICD-10 C33-C34)
Age-standardised incidence and mortality rates by SIMD 2006 deprivation quintile, persons

Deprivation quintile
Rate per 100,000
Incidence
Mortality

Footnote: Small vertical spacing implies very low survival after diagnosis (sadly, still true for most cases)
Pattern C: Reverse SES Gradient (Incidence Only)

Malignant melanoma of the skin (ICD-10 C43)
Age-standardised incidence and mortality rates by SIMD 2006 deprivation quintile, persons

Clear “Lanzarote effect” (esp. *children* of the privileged)

BUT no mortality penalty (early presentation?):

![Graph showing the incidence and mortality rates across deprivation quintiles.](image)
Aside: Is Cancer Relatively Non-Responsive to Massive Societal Change?

- Historical evidence from the economic collapse of the old Soviet Union, in the 1990s, strongly suggests that *epidemic* psychosocial stressors have no measurable impact on cancer mortality, but ONLY cancer mortality, *within the next few years’ time* (although much of the societal change in this case was accompanied by much increased alcohol consumption, and so may not be typical of such crises)
All-Cause Mortality, USSR, 1984-94

All Cancer Mortality, USSR, 1984-94

What about more functional indices of wellbeing in the entire population (e.g. from surveys)?

Absolute range over time: Warwick and Edinburgh Mental Health & Well-Being Scale

The will tell how “sensitive to change” this is, but surely unpromising that stable interdecile gap = only 10% of pop\(^n\) mean [cf. Newfoundlander’s self-assessed health status: also Celts!]

A report for the Early Life Working Group of the Scottish Collaboration for Public Health Research and Policy (SCPHRP)

Available at: www.scphrp.ac.uk (July 2010)

What Might Be a More Sensitive and potentially REVERSIBLE Indicator Of SES Inequalities in Health and Function, Over the Life-Course?

The teacher-completed EDI, championed by the late Clyde Hertzman et al. at HELP (UBC), gathers and feeds back local-area data on five domains of children’s cumulative development (after the first few months of school) that predict longer-term school, and thus life, success:

- Physical health and well-being
- Social competence
- Emotional maturity
- Language and cognitive development
- Communication skills and general knowledge.

AND IT CAN BE CHANGED IN <6 YRS!
IN MIRRABOOKA (PERTH) AUSTRALIA, INTENSIVE LOCAL ECD PROGRAM DEVELOPMENT REDUCED EDI VULNERABILITY BY 25%
Outline of SCPHRP EDI pilot in East Lothian (first use of the EDI in the UK?)

- **Phase 1** - Adapt Canadian EDI to Scottish context/school system, feasibility of implementing and test psychometric properties and discriminatory ability in Scotland (2011) √
- **Phase 2** - Implement EDI in whole local authority; validity & reliability testing (2012) √
- **Phase 3** – Facilitate community use of knowledge from the EDI -> Community action to improve preschool ECE programs (2012-13) (in progress)
- **Phase 4** – 2nd wave of EDI assessment in new cohort of school enterers – 2015?

**RESULT:** *EDI needs little Scottish adaptation; domain scores exactly $\frac{1}{2}$ -way between Australian and Canadian scores*
‘Overall developmental vulnerability’ (% children low on at least one/two EDI domains) of Scots East Lothian P1 children by postcode SES (SIMD) quintile in January 2012: a typical EDI GRADIENT

![Graph showing the percentage of children vulnerable in one or more domains across different quintiles.]

- East Lothian: 27.3%
- Quintile 1: 38.5%
- Quintile 2: 38.4%
- Quintile 3: 30.5%
- Quintile 4: 23.2%
- Quintile 5: 16.7%

- % Vulnerable in 1 or more Domains

- East Lothian: 15.4%
- Quintile 1: 25.6%
- Quintile 2: 23.7%
- Quintile 3: 16.4%
- Quintile 4: 12.8%
- Quintile 5: 7.2%

- % Vulnerable in Two or more Domains
TO SUM UP:

• Many if not most current population health indicators -- based mostly on natality, mortality, self-reported morbidity and hospitalization data -- seem inadequately “sensitive”/responsive to feasible 5-year policy initiatives to reduce health inequalities, especially those directed at early life (which have the most promise for large, efficient effects from relatively feasible preschool early child development programmes.) The EDI fits the bill – to a tee.

• To substantially improve our national health surveillance system will require more comprehensive record-linkage, especially across the public service sectors, across “virtual cohorts” of different ages. Ideally, one could then construct a population “Human Misery Index” that summed up the descriptive epidemiology, including SES gradients, for all households with one or more members who experienced, in a given year, any of the following:
  • a serious health event or “crossed a key disability threshold”
  • a significant criminal justice or child welfare event
  • entry into social welfare or disability payments, or loss of work
  • forced eviction from housing
  • a failure in the school system
  • your choice of any other administratively routinely collected indicator of human suffering!

Implementing such holistic measures, of population health status and health inequalities, is underway in Scotland – just give us time!
SCPHRP Core Mandate and Approach (as established in 2007 by MRC and CSO -- our funders)

- To identify key areas of opportunity for developing novel public health interventions that equitably address major health problems in Scotland, and move those forward.

- To foster collaboration between government, researchers and the public health community to develop a national programme of intervention development, large-scale implementation and robust evaluation.

- Build capacity within the public health community for collaborative research of the highest quality, with maximum impact on policies, programs and practice.
SCPHRP’s Evolution

1st 5 Years

PHASE 1
• SCPHRP Working Groups set up
• 4 Research Fellows hired
• Environmental scans – done & disseminated

PHASE 2
• 20 seed grants given, 4 major external grants won
• Renewed Working Groups (May 2012)
• Social media/ new partnerships

PHASE 3
• Four new Programmes/ exemplar projects; > 25 Collaborators
• Working-Group-led intervention development/pilots (small external grants)

2nd 5 Years

PHASE 4
• 2nd wave of major external intervention grants led by Working Group members, Collaborators & SCPHRP staff/ PDRFs

Evidence Synthesis; Networking & Collaborating
Capacity Building for Intervention Development
Improving the Evidence – Base; Piloting Interventions; Influencing Policy
Embedding in Scotland of best-practice KTE activities ► long-term sustainability

Reflections on the four Working Groups

Now about 2000!
New awards scheme that recognises and rewards promising practices in projects working with young people across Scotland.

Joint initiative with Mentor and SCPHRP (with involvement from NHS Health Scotland and Young Scot)

Award focuses on projects with evaluation and youth participation

24 projects have applied. Award ceremony in February. Award will include evaluation advice and support from SCPHRP

Young People, Mental Health and the Arts

Partnership project between SCPHRP, Royal Lyceum Theatre, Edinburgh, Stirling University and Lisa Nicol, Filmmaker

Symposium at the Lyceum theatre (to coincide with a play on mental health – Taking over the asylum)

Film project with Lisa Nicol (to be shown at Symposium) – young people involved in all stages

Research project exploring young people’s experience of the film project (SCPHRP)
Policy Impact

- Expert committee set up in 2010 by the SG Health Finance and Analytical Services Directorates for *NHS Quality Strategy Indicators initiative*

- 14 professionals, serving as technical, policy or clinical leads for reviewing Level 1 Early Years Indicators – *SCPHRP Fellow Dr. Rosemary Geddes agreed to be one of technical leads*

- The leads contributed via email and face-to-face

- **Case Study: NHS Quality Strategy 2010/2011 and Preventative Spending Inquiry by Scottish Parliament** meetings to the key indicators proposed by the Chief Medical Officer, Dr Harry Burns
Capacity Building
New CPD Courses Developed and Piloted by SCPHRP (delivered thus far to one NHS-HB PHD, NHS-HS/HAS)

“Critical Appraisal for Public Health;” “Pitfalls and Tips”
Six sessions developed (taught by entire SCPHRP team)
Topics:
**RCTs of Screening**: The Example of PSA and Prostate Cancer
**Non-RCT Evaluations of PH Interventions**: The Example of the 2006 Smoke-Free Laws in Scotland
**Meta-Analyses of Environmental Hazard Causation Studies**: The Example of 2nd-Hand Smoke and Breast Cancer
**Complex Studies of Nutrition and Health**: EPIC Cohort Analysis of Fruit/Vegetable Consumption and All Cancers
**Measuring and Monitoring Health Inequalities by SES**: A two-part session on 1) basic methods and 2) current challenges in Scotland in using routinely collected health statistics for this purpose
**Pitfalls and Tips in Interpreting Measures of Population Health Status**: Interactive half-day (or two-session) seminar for public health staff
SCPHRP Traineeships

MRC-CSO Career Development Fellows:
• Helen Frost (Sept 2009)
• Rosemary Geddes (July 2009), replaced by Larry Doi (2012-)
• Caroline Jackson (Sept 2009), replaced by John McAteer (2012-)
• John Mooney (Sept 2009)

Associates/Internships/Post-Docs:
• Martin Higgins (Oct 2009 -) – MSc dissertation on obesity policy-drivers
• Rob Young (July- December 2010) – MRC PhD Studentship on spline analyses of non-linear SES gradients in health outcomes in Scotland
• Katherine Smith (PDF transfer from Bristol to University of Edinburgh: Jan 2011) – ESRC-MRC PDF on tracing the influence of ideas as markers of the science to policy process
• Accredited placement (6 months) for Public Health SpRs – initial SpR Tara Shivaji started January 2011, working on qualitative aspects of EDI pilot in East Lothian (see below)
Reflecting on the past to build bridges for the future
Lessons Learned

- Learned enormous amount about the rapid review of public health intervention literature

- Work of Working Groups has to build on interests/needs of group members in order to maintain momentum

- There is enthusiasm for developing critical appraisal skills in CPD but busy public health staff find it difficult to prioritise course attendance over their day job: offer other CPD formats? (SCPHRP would need a partner organization!)

- Scottish Government have been generally receptive to our ideas but long-term engagement challenging: nifty ideas “penetrate:”
Developing a Consensus Process

• We believe that broad **buy-in beforehand** by both senior policy-makers at SG level, and other stakeholders (e.g. LAs/HBs, Voluntary Sector, local community representatives) is essential, if pilots of interventions are to lead to subsequent action. **This takes time and trust.**

  ➢ There is considerable international cynicism about whether a successful pilot – of which Scotland has seen many -- can truly lead to fully-funded ramp-up, with robust evaluation by competent researchers

  ➢ To counter this, researchers have to be engaged with policy-makers and practitioners, and vice-versa!

• **SCPHRP is looking at various possible models of further engaging diverse interest groups, in further topic prioritization for 2013-18, for example “deliberative,” “search” and “consensus” processes/conferences – suggestions welcome!**
How to Reach Us

John Frank (Director)
john.frank@ed.ac.uk
Ruth Jepson (Senior Scientific Advisor)
ruth.jepson@ed.ac.uk
Sam Bain (Centre Projects Manager)
samantha.bain@ed.ac.uk
Renee Ingram (Research Assistant)
renee.ingram@ed.ac.uk
